B3 ubiquitin ligase protein mediate ubiquitination and subsequent proteasomal degradation of target proteins. Participates in mRNA export from the nucleus by regulating the transport of hnRNP proteins (By similarity).

PATHWAY: Ubiquitin conjugation; third step.
SUBCELLULAR LOCATION: Nuclear (By similarity).
SIMILARITY: Belongs to the TOMI/PTR1 family.
SIMILARITY: Contains 1 HECT-type E3 ubiquitin-protein ligase domain.
                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE FROM N.A.

The fission yeast ptr1+ gene involved in nuclear mRNA export encodes a putative ubiquitin ligase.";

Biochem. Biophys. Res. Commun. 317:1138-1143(2004).

-I-FUNCTION: Probable ubiquitin ligase protein involved in mRNA export. B3 ubiquitin ligase protein mediate ubiquitination and subsequent proteasomal degradation of target proteins. Probably participates in mRNA export from the nucleus by regulating the transport of hnRNP proteins such as rael.

-I-SUBCELLUMAR LOCATION: Nuclear.

-I-SUBCELLUMAR LOCATION: Nuclear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Asp-rich.
Ubiquitin (By similarity).
L->Q: In ptr1-1; induces defects in mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           17 WFWXIXXXXXXXXXXXXXQFXTGXXRLPXXGFXXLXXXXXXXXXXXXXXXXXXXXXXX

Nature 420:553-573 (2002).

C. - FUNCTION: E3 ubiquitin-protein ligase which accepts ubiquitin from an E2 ubiquitin-conjugating enzyme in the form of a thioester and then directly transfers the ubiquitin to targeted substrates.

C. Interacts with receptor-regulated SMADS specific for the BMP pathway, SMAD1 and SMADS, in order to trigger their ubiquitination and degradation and hence their inactivation (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is the HECT (homologous to E6 carboxyl terminus) E3 ubiquitin ligase WW domain. The WW domain binds to the Smad PY motif, resulting in ubiquitination of Smad by the E3 ubiquitin ligase. The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGF)-beta and/or bone morphogenic protein (BMP)-mediated signalling. The method involves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase WW domain to Smad PY motif, on ubiquitination of Smad involves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase, or on the cellular levels of Smad protein HECT E3 ubiquitin ligase activity. The method is useful for stimulating bone formation in a patient or treating a condition associated with inhibit BMP-mediated signalling are useful for treating inflammation, ageing, cancer and infectious diseases. Agents that augment BMP-mediated signalling are useful for stimulating bone anabolism as well as treating choren bones, osteoporosis, and acute or chronic renal failure. Agents that that inhibit TGF-mediated signalling are useful for treating cancer, that inhibit TGF-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WW domain; cell signalling; growth regulation; cytoskeleton organisation; targeted drug screening; modulator; WW domain interaction; WWP4.
                                                                                                                                                                                                                                                                                                                                                                             Screening for modulators of TGF-beta and/or bone morphogenic protein (BMP) mediated signaling useful for treating cancer and osteoporosis by evaluating the ability of agents to modulate Smad protein degradation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

comples AAW36799-801 and AAW37636-40 are peptides that contain WW domains. The WW domain is a small functional domain found in a large number of proteins from a variety of species including humans, nematodes and yeast. Its name is derived from the observation that two tryptophan residues, one in the amino terminal portion of the WW domain and one in the carboxyl terminal portion, are conserved. Most proteins containing WW domains have a function involving cell signalling and growth regulation or the organisation of the cytoskeleton. Polypeptides containing a WW commain are identified by treating a multivalent recognition unit complex that has selective binding affinity for a WW domain, with many polypeptides and identifying those with selective affinity for the complex. Proteins containing WW domains are used for targeted drug interactions. The valency of the recognition unit is important in determining specificity of interaction with WW domains. In multivalent form specificity is relaxed, but not lost, so proteins containing WW domains similar, but not identical, to the sequence of the peptides' target WW can be detected, including new polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; PDZ domain; WW domain; rat; cow; mouse; fruitfly; protein therapy; gene therapy; PDZ-mediated disease; inward potassium channel; WBP; dimer inhibitor peptide; carboxylate binding loop.

                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a purified polypeptide (I) comprising a WW domain which has a sequence (S1) selected from 11 sequences fully defined in the
                                                                                                                         The invention relates to methods for identifying polypeptides comprising PDZ domains, and their encoding nucleic acids. The sequences are used to identify modulators of their expression, function and activity, for use in the diagnosis and treatment of PDZ related disorders. Antibodies against the proteins and cells that produce them may be used for the treatment of PDZ-mediated disease states. Sequences AAU87843-AAU87974 represent proteins containing PDZ domains, fragments of these proteins and other related peptides used in the methods of the invention
                                                            Methods for identifying polypeptides comprising PDZ domains, the polypeptides and their encoding nucleic acids, useful for the diagnosis and treatment of PDZ related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   WW domain; drug candidate screening; drug discovery; drug modification; drug refinement; immunogen; WW binding protein 2; WWP2; human.

specification, a sequence (S2) selected from 48 sequences fully defined in the specification or a sequence (S3) comprising 683, 906, 224 or 725 amino acids fully defined in the specification. (I) is useful for screening a potential drug candidate, by allowing (I) to come into contact with at least one recognition unit having a selective affinity for the WW domain in (I), in the presence of an amount of a potential drug candidate, such that (I) and the recognition unit are capable of interacting when brought into contact with one another in the absence of the amount of the drug candidate on the interaction of (I) with the recognition unit. (I) is useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological activaties, or as an immunogen to generate antibodies. This is the amino acid sequence of novel human WW binding protein WWP2-3 WW domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formatt directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

```

The present sequence is a consensus WW domain sequence. The WW domain is a small functional domain. Its name is derived from the observation that two tryptophan residues, one in the aminor terminal portion of the WW domain and one in the carboxyl terminal portion, are conserved. Most

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a purified polypeptide (I) comprising a WW domain which has a sequence (S1) selected from 11 sequences fully defined in the specification, a sequence (S2) selected from 48 sequences fully defined in the specification or a sequence (S3) comprising 683, 906, 224 or 725 amino acids fully defined in the specification. (I) is useful for screening a potential drug candidate, by allowing (I) to come into contact with at least one recognition unit having a selective affinity for the WW domain in (I), in the presence of an amount of a potential drug candidate, such that (I) and the recognition unit are capable of interacting when brought into contact with one another in the absence of the drug candidate, and determining the effect, if any, of the presence of the amount of the candidate on the interaction of (I) with the recognition unit. (I) is useful for drug discovery, modification are refinement, for discovering polypeptides involved in pharmacological
proteins containing WW domains have a function involving cell signalling and growth regulation or the organisation of the cytoskeleton.

Polypeptides containing a WW domain are identified by treating a multivalent recognition unit complex that has selective binding affinity for a WW domain, with many polypeptides and identifying those with selective affinity for the complex. Proteins containing WW domains are used for targeted drug screening, i.e. to identify potential modulators of specific WW domain interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      drug modification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel purified polypeptide comprising WW domain, useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological activities, or as an immunogen to generate
                                                                                                                                                                                                                                                                                Gaps

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or inhibit formation on a surface of a by A. fumigatus, or to prevent or inhibit formation on a surface of a by A. fumigatus, or to prevent or inhibit formation on a surface of a capressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic transmisms invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or parabogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination
                                                                                                                                                                   ö
activities, or as an immunogen to generate antibodies. This is the amino acid sequence of a WW domain binding protein associated protein. Note: This sequence appears in the sequence listing but is not further described in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of expression patterns, for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit another immune response, and for identifying polynucleotides encoding the other protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                essential gene; Aspergillus fumigatus; infection; biofilm; antibody; immune response.
                                                                                                                                                                   Gaps

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergilus funigatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic organism such as A. funigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. funigatus, or to prevent or inhibit formation on a surface of a biofilm comprising A. funigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. funigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA similar biochemical activity and/or function, for comparing with DNA similar biochemical activity and/or function, for comparing with DNA similar brothemical activity and/or function; for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and
                                                                                                                                                                                                                                                            ö
with which binding occurs or to identify inhibitors of the binding interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence factors. This sequence represents a protein of one of the essential genes of Aspergillus fumigatus of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          essential gene; Aspergillus fumigatus; infection; biofilm; antibody; immune response.

The WW domain was initially identified in the Yes proto-oncogene associated proteins (YAP8) of chicken, human and mouse (see also AAR97669-70 and AAR97672). A consensus sequence is given in AAR97671. Yeast Rsp5 contains an N-terminal regulatory domain common to protein kinases C and synaptogamins. The Rsp5 wW domains (AAR9768-85) can be expressed in bacterial, yeast, insect or mammalian cells, and used to identify WW domain ligands. They can be introduced into cells, either directly or by gene therapy, to increase the level of signal transduction
                                              response, and for identifying polymucleotides encoding the other protein with which binding occurs or to identify inhibitors of the binding interaction. The polypepides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence factors. This sequence represents a protein of one of the essential genes

```
comples AAW36798-801 and AAW37636-40 are peptides that contain WW domains. The WW domain is a small functional domain found in a large number of proteins from a variety of species including humans, nematodes and yeast. Its name is derived from the observation that two tryptophan residues, one in the amino terminal portion of the WW domain and one in the carboxyl terminal portion, are conserved. Most proteins containing WW domains have a function involving cell signalling and growth requiation or the organisation of the cytoskeleton. Polypeptides containing a WW commain are identified by treating a multivalent recognition unit complex that has selective binding affinity for a WW domain, with many polypeptides and identifying those with selective affinity for the complex. Proteins containing WW domains are used for targeted drug screening, i.e. to identify who domains are used for targeted drug screening, i.e. to identify potential modulators of specific WW domain interactions. The valency of the recognition unit is important in determining specificity of interaction with WW domains. In multivalent commains similar, but not identical, to the sequence of the peptides' target WW can be detected, including new polypeptides

The present sequence is the WW domain of a HECT (homologous to E6 carboxyl terminus) E3 ubiquitin ligase. The WW domain binds to the Smad PY motif, resulting in ubiquitination of Smad by the E3 ubiquitin ligase.

The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGF)-beta and/or bone morphogenic protein (BMP)-mediated signalling. The method involves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase WW domain to Smad PY motif, on ubiquitination of Smad protein by E3 ubiquitin ligase, or on the cellular levels of Smad protein HECT E3 ubiquitin ligase, or on the cellular levels of Smad protein HECT E3 ubiquitin ligase activity. The method is useful for stimulating bone formation in a patient or treating a condition associated with insufficient TGF-beta and/or BMP-mediated cell signalling. Agents that inhibit BMP-mediated signalling are useful for treating inflammation, ageing, cancer and infectious diseases. Agents that augment BMP-mediated signalling are useful for treating concer, signalling are useful for treating cancer, that inhibit TGF-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis

Human, PDZ domain, WW domain, rat, cow, mouse, fruitfly, protein therapy, gene therapy, PDZ-mediated disease, inward potassium channel, WBP, dimer inhibitor peptide, carboxylate binding loop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to methods for identifying polypeptides comprising PDZ domains, and their encoding nucleic acids. The sequences are used to identify modulators of their expression, function and activity, for use in the diagnosis and treatment of PDZ related disorders. Antibodies against the proteins and cells that produce them may be used for the treatment of PDZ-mediated disease states. Sequences ANUR97843-AANUR9794 represent proteins containing PDZ domains, fragments of these proteins and other related peptides used in the methods of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Methods for identifying polypeptides comprising PDZ domains, the polypeptides and their encoding nucleic acids, useful for the diagnosis and treatment of PDZ related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WW domain; drug candidate screening; drug discovery; drug modification; drug refinement; immunogen; WW binding protein 2; WWP2; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                       The invention describes a purified polypeptide (I) comprising a Ww domain which has a sequence (S1) selected from 11 sequences fully defined in the specification, a sequence (S2) selected from 48 sequences fully defined in the specification or a sequence (S3) comprising 683, 906, 224 or 725 amino acids fully defined in the specification. (I) is useful for screening a potential drug candidate, by allowing (I) to come into contact with at least one recognition unit having a selective affinity for the Ww domain in (I), in the presence of an amount of a potential drug candidate, such that (I) and the recognition unit are capable of the drug candidate, and determining the effect, if any, of the presence of the amount of the drug candidate on the interaction of (I) with the recognition unit. (I) is useful for drug discovery, modification and activaties, or as an immunogen to generate antibodies. This is the amino acityties, or as an immunogen to generate antibodies. This is the amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WW domain; drug candidate screening; drug discovery; drug modification; drug refinement; immunogen; WW binding protein; yeast; Rsp5; WW domain.
                                                                                                                                                                                               Novel purified polypeptide comprising WW domain, useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological activities, or as an immunogen to generate

The invention describes a purified polypeptide (1) comprising a Ww domain which has a sequence (S1) selected from 11 sequences fully defined in the specification, a sequence (S2) selected from 48 sequences fully defined in the specification or a sequence (S3) comprising 683, 906, 224 or 725 amino acids fully defined in the specification. (1) is useful for screening a potential drug candidate, by allowing (1) to come into contact with at least one recognition unit having a selective affinity for the WW domain in (1), in the presence of an amount of a potential charge candidate, such that (1) and the recognition unit are capable of interacting when brought into contact with one another in the absence of the amount of the drug candidate, and determining the effect, if any, of the presence of the amount of the drug candidate on the interaction of (1) with the recognition unit. (1) is useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological activities, or as an immunogent to generate antibodies. This is the amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ·.
                                                                                                                                                                                                                                                                      Novel purified polypeptide comprising WW domain, useful for drug discovery, modification and refinement, for discovering polypeptides involved in pharmacological activities, or as an immunogen to generate

"The novel HECT-type ubiquitin-protein ligase Pub2p shares partially overlapping function with Publp in Schizosaccharomyces pombe.";

Gell Sci. 115:1847-1857(2002).

-!- FUNCTION: E3 ubiquitin-protein ligase which accepts ubiquitin from an E2 ubiquitin-conjugating enzyme in the form of a thioester and then directly transfers the ubiquitin to targeted substrates.

Regulates ubiquitination of cdc25.
-!- PATHWAY: Ubiquitination of cdc25.
-!- SUBCELLULAR LOCATION: Membrane-associated, and cytoplasmic.
-!- MISCELLANBOUS: A cysteine residue is required for ubiquitin-thiolester formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SIMILARITY: Contains 1 C2 domain.

L -> S (in RSPE-1; impaired in ubiquitin-
thioester formation and catalysis of
substrate ubiquitination).
C->A: Loss of ubiquitination.
6F1836384479E70F CRC64;
                 PATHWAY: Ubiquitin conjugation, third step.
SUBCELDULAR LOCATION: Cytoplasmic and nuclear (Potential).
SUBCELLULAR LOCATION: Cytoplasmic and nuclear (Potential).
INT. The ubiquitination appears to be the result of an INT. A cytoplasmic stansfer of ubiquitin.
MISCELLANEOUS: A cysteine residue is required for ubiquitin-thiolester formation.
SIMILARITY: Contains 1 C domain.
SIMILARITY: Contains 1 HECT-type E3 ubiquitin-protein ligase

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mercurio FM; Murray BW, Hoekstra MF, Xie W, WPI; 2001-327913/34.

Screening for modulators of TGF-beta and/or bone morphogenic protein (BMP) mediated signaling useful for treating cancer and osteoporosis by evaluating the ability of agents to modulate Smad protein degradation.

Disclosure; Page 13; 75pp; English.

The present sequence is the ww domain of a HECT (homologous to E6 carboxyl terminus) E3 ubiquitin ligase. The Ww domain binds to the Smad Py motif, resulting in ubiquitination of Smad by the E3 ubiquitin ligase. The sequence is provided in a specification relating to a method for screening for agents that modulate transforming growth factor (TGF)-beta and/or bone morphogenic protein (BMP)-mediated signalling. The method involves evaluating the effect of an agent on binding of HECT E3 ubiquitin ligase WW domain to Smad Py motif, on ubiquitination of Smad protein by E3 ubiquitin ligase, or on the cellular levels of Smad protein

```
ö
          bone formation in a patient or treating a condition associated with insufficient TGF-beta and/or BMP-mediated cell signalling. Agents that inhibit BMP-mediated solutions are useful for treating inflammation, ageing, cancer and infectious diseases. Agents that augment BMP-mediated signalling are useful for stimulating bone anabolism as well as treating broken bones, osteoporosis, and acute or chronic renal failure. Agents that inhibit TGF-mediated signalling are useful for treating cancer, inflammation, neurodegeneration and fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Viral infection; lymphosarcoma; human immunodeficiency virus; hepatitis; poliomyelitis; HIV; measles; protein therapy; human; NEDD4.
